Instructions for the lab seminar in
TBMI02 Medical Image Analysis

Autumn 2008

The aim of the seminar is to present and discuss the laborations that has been done in the course, MRI, image registration and image segmentation.

The whole group is divided in two smaller groups that will participate in one occasion each. Persons that have done the laborations together will participate in different occasions. These groups will then be divided into groups of 2-3 persons. Each such group is responsible for the presentation of one laboration and lead the discussion of another laboration. A ground for the discussion of respective lab shall be handed in by each group to the group that is responsible for the discussion. This material shall be sent by e-mail to the course assistant for forwarding to the respective discussion leaders.

The presentation shall be about 10 minutes long and give a brief introduction to the assignment, a description of how the assignment was solved and the results you got. After each presentation follows a discussion where all the participants will discuss about different solutions and problems. The idea with this discussion is that the course participants will help each other to understand the laborations and discuss different ways to solve the assignment.

This discussion will be held by a group (not the same group that did the presentation) with a ground in form of questions that have been sent in by the other participands. This group will also make sure that the discussion will not go on for more than 10 minutes.
